## ABSTRACT:

PROBLEM TO BE SOLVED: To prevent a customer for executing settlement by a debit card in a restaurant, etc., with a charge credit system from being unconscious of shortage in the balance of a bank account until payment.

SOLUTION: A card reader for the debit card is arranged in an input part. The input part decides that a money amount being equal to or more than the price of a merchandise which the customer orders is to be drawn from the account when he or she orders, who executes settlement by the debit card. When data of the debit card are inputted by the card reader, the drawing of the money amount to be drawn is demanded to a financial organ having the account of the debit card. A storage management part cumulatively stores the drawn money amount as the one to be kept by customer when the establishment response of drawing is received from the financial organ. A settlement processing art compares the money amount to be kept in the storage management part with the price for the whole merchandises ordered by him or her in the case the customer executes settlement by the debit card and it outputs a difference amount as a return when the kept money amount is more than the price of the whole ordered merchandises.
